SERIAL NO: 10/684,132
DOCKET NO: 149-0101US**CLAIM LISTING**

1. (Original) A method for reducing the amount of data of system metrics collected or reported from agent nodes to a system performance monitor for system performance monitoring and analysis, the method comprising the steps of:
 - sampling a first system metric and obtaining a sampled value of the first metric;
 - reporting the sampled value of the first metric if the sampled value is not between a first parameter and a second parameter;
 - not reporting the sampled value if the sampled value is between the first and second parameters; and
 - wherein the first parameter and the second parameter are any real numbers.
2. (Original) The method in Claim 1, wherein the first parameter and the second parameter are derived from sampled values of the first system metric.
3. (Original) The method in Claim 1, wherein the first parameter and the second parameter are derived from at least one statistical parameter of the sampled values of the first system metric.
4. (Original) The method in Claim 3, wherein the at least one statistical parameter of the sampled values of the first system metric includes the first moment of the sampled values.
5. (Original) The method in Claim 4, wherein the at least one statistical parameters of the sampled values of the first system metric further includes the second moment of the sampled values.
6. (Currently Amended) The method in Claim 1, further comprising[[],] assuming the sampled value of the first metric that is not reported with an average, wherein the average is an average of previously sampled data of the first system metric.

SERIAL NO: 10/684,132
DOCKET NO: 149-0101US

7. (Currently amended) The method in Claim [[1]] 6, wherein the average is a running average.
8. (Currently Amended) The method in Claim 1, further comprising[[.]] assuming the sampled value of the first metric that is not reported with an average, wherein the first parameter is zero and the second parameter is a positive number.
9. (Currently Amended) The method in Claim 1, further comprising[[.]] calculating a weighted running average, wherein $\bar{d}_n(w) = d_n w + \bar{d}_{n-1}(1-w)$, \bar{d}_n and \bar{d}_{n-1} are the weighted running average after n 'th or $(n-1)$ 'th sampling, w is the weighing factor for the sampling,
- $$S_n = S_{n-1} + (n-1)(d_n - \bar{d}_{n-1})^2 / n$$
- $\sigma_n^2 = S_n / n$, wherein S_n , S_{n-1} are the sum of the differences squared, σ_n is the standard deviation, calculating the first parameter to be $(\bar{d}_n - a\sigma_n)$ and calculating the second parameter to be $(\bar{d}_n + b\sigma_n)$, wherein a and b are two constant real numbers.
10. (Original) The method in Claim 9, wherein a and b are any real numbers between 0.5 and 3.1.
11. (Original) The method in Claim 10, wherein a and b are 1.
12. (Original) The method in Claim 9, wherein continuing sampling is repeated for N times, wherein N is an integer.
13. (Original) The method in Claim 12, wherein the w is between $1/N$ and $2/N$.
14. (Original) The method in Claim 12, wherein N is determined by the confidence interval cl , the tolerable variance error e_v , wherein $e_v = \frac{100 f(cl)^2}{N}$, wherein $f(cl)$ is the $(1 + cl/100)/2$ -quantile of the unit normal distribution.

SERIAL NO: 10/684,132
DOCKET NO: 149-0101US

15. (Currently Amended) The method in Claim 9, further comprising:
reporting the weighted running average \bar{d}_{iN} where iN is a multiple of N , i is an integer;
and
reporting \bar{d}_n and replacing \bar{d}_{iN} with \bar{d}_n when the $|\bar{d}_n - \bar{d}_{iN}|$ is greater than dd , wherein dd is a real number.
16. (Original) The method in Claim 15, wherein dd is σ_n .
17. (Currently Amended) The method in Claim 9, wherein the $w = c/n$, wherein c is a real number, and n is the n 'th sampling.
18. (Original) The method in Claim 17, wherein c is between 0.5 and 2.
19. (Original) The method in Claim 1, further comprising:
sampling a second system metric and obtaining a sampled value of the second system metric;
calculating the correlation coefficient cc between the sampled value of the first system metric and the second system metric after M sampling;
stopping sampling and stopping reporting the sampled value of the second system metric if $|cc|$ is not less than a threshold; and
continuing sampling and reporting the sampled value of the second system metric if $|cc|$ is less than a threshold, wherein $|cc|$ is the absolute value of correlation coefficient cc .
20. (Currently Amended) The method in Claim 1, further comprising:
~~at the system performance monitor, receiving, at the system performance monitor, the~~
reported sampled value of the first metric; and
~~at the system performance monitor, assuming, at the system performance monitor, the~~
sampled value of the first metric as an average for the sampled value not reported.

21. (Currently Amended) The method in Claim 20, further comprising[[:]] displaying the received and assumed values of the first metric.
22. (Currently Amended) A method for reducing the amount of data of system metrics collected or reported from agent nodes to a system performance monitor for system performance monitoring and analysis, the method comprising the steps of:
- sampling a first and a second system metrics and obtaining sampled values of the first and second system metrics;
 - calculating the correlation coefficient cc between the sampled value of the first system metric and the second system metric after M sampling, wherein M is an integer;
 - stopping sampling and not stepping report[[:ing]] the sampled value of the second system metric if $|cc|$ is not less than a threshold; and
 - continuing sampling and report[[:ing]] the sampled value of the second system metric if $|cc|$ is less than a threshold, wherein $|cc|$ is the absolute value of correlation coefficient cc .
23. (Original) The method in Claim 22, wherein the threshold is 0.7.
24. (Original) The method in Claim 22, wherein the threshold is 0.9.
25. (Original) The method in Claim 22, wherein further comprising:
- after stopping sampling and stopping reporting the sampled value of the second system metric if $|cc|$ is not less than a threshold, estimating the value of the second system metric using the reported value of the first system metric when the first system metric is reported.
26. (Original) A computer system module for system performance monitoring, reporting and analysis, the module comprising:
- a controller module operative to control the system performance monitoring;
 - a sampling module coupled to the controller module, operative to sample at least a first system metric and obtaining a sampled value of the first metric;

REPLY TO OFFICE ACTION OF JUNE 14, 2005

SERIAL NO: 10/684,132
DOCKET NO: 149-0101US

~~a reporting module coupled to the sampling module, wherein operative to report~~ each sampled value of the first metric is reported if the sampled value is not between a first parameter and a second parameter, and not ~~reported to report the sampled value,~~ if the sampled value is between the first and second parameters;

wherein the first parameter and the second parameter are any real numbers.

27. (Original) The computer system module as in Claim 26, wherein the first parameter and the second parameter are derived from sampled values of the first system metric.
28. (Original) The computer system module as in Claim 26, wherein the first parameter and the second parameter are derived from at least one statistical parameter of the sampled values of the first system metric.
29. (Original) The computer system module as in Claim 28, wherein the at least one statistical parameter of the sampled values of the first system metric includes the first moment of the sampled values.
30. (Original) The computer system module as in Claim 29, wherein the at least one statistical parameters of the sampled values of the first system metric further includes the second moment of the sampled values.
31. (Original) The computer system module as in Claim 26, wherein the controller module is operative to calculate an average, wherein the average is an average of previously sampled data of the first system metric.
32. (Original) The computer system module as in Claim 26, wherein the controller module is operative to calculate an average, wherein the average is a running average.
33. (Original) The computer system module as in Claim 26, wherein the first parameter is zero and the second parameter is a positive number.

SERIAL NO: 10/684,132
DOCKET NO: 149-0101US

34. (Original) The computer system module as in Claim 26, wherein the controller module is operative to calculate a weighted running average, wherein $\bar{d}_n(w) = d_n w + \bar{d}_{n-1}(1-w)$, \bar{d}_n and \bar{d}_{n-1} are the weighted running average after n 'th or $(n-1)$ 'th sampling, w is the weighing factor for the sampling,

$$S_n = S_{n-1} + (n-1)(d_n - \bar{d}_{n-1})^2 / n$$

$\sigma_n^2 = S_n / n$, wherein S_n S_{n-1} are the sum of the differences squared, σ_n is the standard deviation, and to calculate the first parameter to be $(\bar{d}_n - a\sigma_n)$ and the second parameter to be $(\bar{d}_n + b\sigma_n)$, wherein a and b are two constant real numbers.

35. (Original) The computer system module in Claim 26, wherein the controller module is operative to stop sampling after N times, wherein N is an integer.

36. (Original) The computer system module in Claim 35, wherein N is determined by a confidence interval cl , a tolerable variance error e_v , wherein $e_v = \frac{100f(cl)^2}{N}$, wherein $f(cl)$ is the $(1 + cl/100)/2$ -quantile of the unit normal distribution.

37. (Original) The computer system module in Claim 35, wherein the controller module is operative to report the weighted running average \bar{d}_{iN} where iN is a multiple of N , i is an integer; and
to report \bar{d}_n when the $|\bar{d}_n - \bar{d}_{iN}|$ is greater than dd , wherein dd is a real number.

38. (Original) The computer system module in Claim 37, wherein dd is σ_n .

39. (Original) The computer system module in Claim 34, wherein the $w = c/n$, wherein c is a real number, n is the n 'th sampling.

DOCKET NO: 149-0101US

40. (Currently Amended) The computer system module in Claim 26,
wherein the controller module is operative to sample a second system metric and to
obtain a sampled value of the second system metric;
to calculate the correlation coefficient cc between the sampled value of the first system
metric and the second system metric after M sampling;
to stop sampling and ~~stop reporting~~ not report the sampled value of the second system
metric if $|cc|$ is not less than a threshold; and
to continue sampling and report~~[[ing]]~~ the sampled value of the second system metric if
 $|cc|$ is less than a threshold, wherein $|cc|$ is the absolute value of correlation coefficient cc .
41. (Original) The computer system module in Claim 40, wherein the threshold is 0.7.
42. (Currently Amended) The computer system module in Claim 26, further comprising~~[[,]]~~
monitoring module operative to receive the reported sampled value of the first metric and to
assume the sampled value of the first metric as an average for the sampled value not reported.
43. (Currently Amended) The computer system module in Claim 41, further comprising ~~[[,]]~~
a display module operative to display the received and assumed values of the first metric.
44. (Currently Amended) A computer system module for system performance monitoring,
reporting and analysis, comprising:
a controller module operative to control the system performance monitoring;
a sampling module coupled to the controller module, operative to sample at least a first
and a second system metrics and obtaining sampled values of the first and second metrics;
~~a reporting module coupled to the sampling module;~~
wherein the controller module is operative to calculate the correlation coefficient cc
between the sampled value of the first system metric and the second system metric after M
sampling, wherein M is an integer;

REPLY TO OFFICE ACTION OF JUNE 14, 2005

SERIAL NO: 10/684,132
DOCKET NO: 149-0101US

to stop sampling and to ~~stop reporting~~ not report the sampled value of the second system metric if $|cc|$ is not less than a threshold; and

to continue sampling and to report ~~reporting~~ the sampled value of the second system metric if $|cc|$ is less than a threshold, wherein $|cc|$ is the absolute value of correlation coefficient cc .

45. (Original) The computer system module in Claim 44, wherein the threshold is 0.7.

46. (Currently Amended) A computer network system comprising:

a plurality of network nodes having

a CPU;

a memory module coupled to CPU, operative to contain computer executable programs; and

a network interface operative to interconnect different nodes of the network,

wherein one computer executable program is loaded in the memory module in one node, wherein the computer executable program is operative to perform the method in any one of claims 1 – 25.

47. (Currently Amended) A machine readable medium comprising a machine executable program, wherein the machine executable program is operative to perform the method in any one of claims 1 – 25.
